Static control made Easy!

High voltage spark over can be used in a controlled way. A spark over from a special electrode to a ground reference can be detected and evaluated. Perforations in plastic webs can be detected and counted.

The Perfomaster provides the hardware and software to generate a controlled spark over, detect this and evaluate the spark over to produce a pulse signal. The pulse signal is available on the output connector and can be used for counting detected spark-overs and thus perforations.

The miniature design of the Perfomaster contains the electrode as well as the high voltage source. It is powered by 24 V DC, so no high voltage cable is required. Electrodes are standard fitted with three special alloy emitter pins and are detachable for replacement or remote placement.

A status LED provides direct system information on the Perfomaster. A green LED signals operation OK. An intermittent red LED signals a perforation detected.

Supply voltage and output voltage setting to the Perfomaster can be provided in two ways:

1. Directly from the machine f.e. PLC
2. With additional external control kit

**Technical specifications**

- **Housing material**: ABS / PTFE
- **Cable**: low voltage cable, standard M12 connector
- **Input power**: 24 V DC, <0.5 A
- **Emitter pins**: special alloy
- **Max detection frequency**: 25 Hz
- **Signal**: Multicolour LED
  - Green, signal "operation ok"
  - Red, signal perforation detected
- **Signal output**: Optocoupler
- **Control voltage**: 0 - 10 V DC or 0 - 24 V DC
- **Ambient temperature**: 0 - 55°C
- **Use circumstances**: industrial
- **Protection classification**: IP 54

**Perfomaster**
